Additional information regarding attempted service, etc:

Federal Rule of Civil Procedure 45 (c), (d), and (e) (Effective 12/1/07)**(c) Protecting a Person Subject to a Subpoena.**

(1) *Avoiding Undue Burden or Expense; Sanctions.* A party or attorney responsible for issuing and serving a subpoena must take reasonable steps to avoid imposing undue burden or expense on a person subject to the subpoena. The issuing court must enforce this duty and impose an appropriate sanction — which may include lost earnings and reasonable attorney's fees — on a party or attorney who fails to comply.

(2) Command to Produce Materials or Permit Inspection.

(A) *Appearance Not Required.* A person commanded to produce documents, electronically stored information, or tangible things, or to permit the inspection of premises, need not appear in person at the place of production or inspection unless also commanded to appear for a deposition, hearing, or trial.

(B) *Objections.* A person commanded to produce documents or tangible things or to permit inspection may serve on the party or attorney designated in the subpoena a written objection to inspecting, copying, testing or sampling any or all of the materials or to inspecting the premises — or to producing electronically stored information in the form or forms requested. The objection must be served before the earlier of the time specified for compliance or 14 days after the subpoena is served. If an objection is made, the following rules apply:

(i) At any time, on notice to the commanded person, the serving party may move the issuing court for an order compelling production or inspection.

(ii) These acts may be required only as directed in the order, and the order must protect a person who is neither a party nor a party's officer from significant expense resulting from compliance.

(3) Quashing or Modifying a Subpoena.

(A) *When Required.* On timely motion, the issuing court must quash or modify a subpoena that:

(i) fails to allow a reasonable time to comply;

(ii) requires a person who is neither a party nor a party's officer to travel more than 100 miles from where that person resides, is employed, or regularly transacts business in person — except that, subject to Rule 45(c)(3)(B)(iii), the person may be commanded to attend a trial by traveling from any such place within the state where the trial is held;

(iii) requires disclosure of privileged or other protected matter, if no exception or waiver applies; or

(iv) subjects a person to undue burden.

(B) *When Permitted.* To protect a person subject to or affected by a subpoena, the issuing court may, on motion, quash or modify the subpoena if it requires:

(i) disclosing a trade secret or other confidential research, development, or commercial information;

(ii) disclosing an unretained expert's opinion or information that does not describe specific occurrences in dispute and results from the expert's study that was not requested by a party; or

(iii) a person who is neither a party nor a party's officer to incur substantial expense to travel more than 100 miles to attend trial.

(C) *Specifying Conditions as an Alternative.* In the circumstances described in Rule 45(c)(3)(B), the court may, instead of quashing or modifying a subpoena, order appearance or production under specified conditions if the serving party:

(i) shows a substantial need for the testimony or material that cannot be otherwise met without undue hardship; and

(ii) ensures that the subpoenaed person will be reasonably compensated.

(d) Duties in Responding to a Subpoena.

(1) *Producing Documents or Electronically Stored Information.* These procedures apply to producing documents or electronically stored information:

(A) *Documents.* A person responding to a subpoena to produce documents must produce them as they are kept in the ordinary course of business or must organize and label them to correspond to the categories in the demand.

(B) *Form for Producing Electronically Stored Information Not Specified.* If a subpoena does not specify a form for producing electronically stored information, the person responding must produce it in a form or forms in which it is ordinarily maintained or in a reasonably usable form or forms.

(C) *Electronically Stored Information Produced in Only One Form.* The person responding need not produce the same electronically stored information in more than one form.

(D) *Inaccessible Electronically Stored Information.* The person responding need not provide discovery of electronically stored information from sources that the person identifies as not reasonably accessible because of undue burden or cost. On motion to compel discovery or for a protective order, the person responding must show that the information is not reasonably accessible because of undue burden or cost. If that showing is made, the court may nonetheless order discovery from such sources if the requesting party shows good cause, considering the limitations of Rule 26(b)(2)(C). The court may specify conditions for the discovery.

(2) Claiming Privilege or Protection.

(A) *Information Withheld.* A person withholding subpoenaed information under a claim that it is privileged or subject to protection as trial-preparation material must:

(i) expressly make the claim; and

(ii) describe the nature of the withheld documents, communications, or tangible things in a manner that, without revealing information itself privileged or protected, will enable the parties to assess the claim.

(B) *Information Produced.* If information produced in response to a subpoena is subject to a claim of privilege or of protection as trial-preparation material, the person making the claim may notify any party that received the information of the claim and the basis for it. After being notified, a party must promptly return, sequester, or destroy the specified information and any copies it has; must not use or disclose the information until the claim is resolved; must take reasonable steps to retrieve the information if the party disclosed it before being notified; and may promptly present the information to the court under seal for a determination of the claim. The person who produced the information must preserve the information until the claim is resolved.

(e) **Contempt.** The issuing court may hold in contempt a person who, having been served, fails without adequate excuse to obey the subpoena. A nonparty's failure to obey must be excused if the subpoena purports to require the nonparty to attend or produce at a place outside the limits of Rule 45(c)(3)(A)(ii).

Schedule A

DEFINITIONS

1. **“Plaintiff”** or **“YYZ”** shall mean Plaintiff YYZ, LLC, including any predecessors in interest (including without limitation Promenix, Inc.), parent organizations, affiliations, subsidiaries, or divisions; any and all corporations, firms, or other persons owned or controlled by YYZ; YYZ’s present and former officials, executives, officers, associates, partners, employees, representatives, directors, attorneys, staff members, and agents; all other persons acting or purporting to act on behalf of YYZ; and/or any other related entities of YYZ.
2. **“Defendants”** shall refer collectively to defendants Adobe Systems, Inc., Hewlett Packard Company, Software AG Inc., Software AG, BMC Software Inc. Pegasystems, Inc., and any additional defendants in **Related Actions**.
3. **“Related Actions”** shall refer to the following actions: *YYZ, LLC v. Adobe Systems, Inc.*, Civil No. 13-579-SLR (D. Del.); *YYZ, LLC v. Hewlett Packard*, Case No. 13-136-SLR (D. Del.); *YYZ, LLC v. Software AG Inc., et al.*, 13-137-SLR (D. Del.); *YYZ, LLC v. BMC Software, Inc.*, Case No. 13-580-SLR (D. Del.); *YYZ, LLC v. Pegasystems, Inc.*, Case No. 13-581-SLR (D. Del.); *YYZ, LLC v. Fujitsu America Inc. et al.*, Case No. 12-167-SLR (D. Del.), *YYZ, LLC v. Hewlett Packard Company*, Case No. 12-168-SLR (D. Del.), *YYZ, LLC v. Software AG Inc., et al.*, Case No. 12-169-SLR (D. Del.), *YYZ, LLC v. Tibco Software Inc.*, Case No. 12-170-SLR (D. Del.), *YYZ, LLC v. Metastorm, Inc.*, Case No. 2:11-cv-00931-JCJ (E.D.P.A.), *YYZ, LLC v. Metastorm, Inc., et al.*, 2:11-cv-01609-JCJ (E.D.P.A.), and *Intersystems Corp. v. YYZ, LLC*, 2:11-cv-06602-JCJ (E.D.P.A.).
4. **“Third party”** means and includes any person or persons other than **Defendants**

and **YYZ**.

5. **“You” or “your”** shall mean Julie Chovanes and any prior names used by Julie Chovanes, as well as any attorneys, patent agents or other staff working for or with Ms. Chovanes in connection with the prosecution of one or more of the patents-in-suit.

6. **“Document”** shall be given the broadest meaning accorded that term by Federal Rule of Civil Procedure 34(a) and includes, but is not limited to, all of the items defined in Federal Rule of Evidence 1001, all non-identical copies, all preliminary and final drafts of any such item, and all electronically stored information.

7. **“Communication”** means any transmission or exchange of information, data, opinions, or thoughts, whether in writing, orally, or otherwise.

8. **“Relate,” “refer,” and “regard”** and variations thereof, are used in their broadest possible sense and include all matters comprising, constituting, containing, concerning, embodying, reflecting, involving, discussing, describing, analyzing, identifying, stating, referring to, dealing with, or in any way pertaining to, for each request whichever definition makes the request most inclusive.

9. **“749 patent”** shall mean U.S. Patent No. 7,062,749 listing Vincent R. Cyr and Kenneth Fritz as inventors, filed on December 15, 2000, issued on June 13, 2006, titled “Measuring, Monitoring and Tracking Enterprise Communications and Processes,” and asserted by **YYZ** in the **Related Actions**, and shall include the results of reissue proceedings, reexamination proceedings or any other post-grant proceedings attached hereto as **Exhibit A**.

10. **“674 patent”** shall mean U.S. Patent No. 7,603,674 listing Vincent R. Cyr and

Kenneth Fritz as inventors, filed on April 5, 2006, issued on October 13, 2009, titled “Apparatus and System for Measuring, Monitoring, Tracking and Simulating Enterprise Communications and Processes”, and asserted by **YYZ** in the **Related Actions**, and shall include the results of reissue proceedings, reexamination proceedings or any other post-grant proceedings attached hereto as **Exhibit B**.

11. “**Patents-in-suit**” shall means ‘**749 patent** and ‘**674 patent**.

12. “**Related patents or applications**” means all provisional, continuation, continuation-in-part, divisional, reissue, or reexamination applications filed with respect to the **patents-in-suit** and their foreign counterparts, including without limitation U.S. Patent No. 8,046,747.

13. “**Prior art**” is used herein in the same sense that it is used in 35 U.S.C. § 103 and includes any patent, printed publication, prior knowledge, prior use, prior sale or offer for sale, or other act or event defined in 35 U.S.C. § 102 taken singly or in combination, including any such art with a relevant date before December 15, 2000.

14. “**Person**” means any natural person, firm, association, organization, partnership, business, trust, corporation, association, or public entity.

15. As used herein, the singular form of a noun or pronoun shall be considered to include within its meaning the plural form of a noun or pronoun so used, and vice versa; the use of the masculine form of a pronoun shall be considered to include also within its meaning the feminine form of the pronoun so used, and vice versa; the use of any tense of any verb shall be considered to include within its meaning all other tenses of the verb so used.

16. The connectives “and” and “or” shall be construed either disjunctively or conjunctively as necessary to bring within the scope of the discovery request all responses that might otherwise be construed to be outside of its scope.

17. “Any” includes the word “all” and vice versa.

INSTRUCTIONS

1. Each document should be segregated and identified by the request to which it is primarily responsive or produced as it is kept in the usual course of business.

2. In responding to these requests, furnish all documents that are available, including attachments and enclosures, including documents in the possession of attorneys, agents, employees, representatives or any other person directly or indirectly employed by or connected with you or your attorneys, and anyone else subject to your control.

3. With respect to those documents or records claimed to be in whole or in part privileged or otherwise protected from disclosure (e.g., attorney-client privilege, work product), identify in writing, on or before the date of production:

- a. the type of document (*e.g.*, “letter,” “memorandum”);
- b. the identity of each document’s author, writer, sender and all other persons participating in the preparation of the document;
- c. each document’s recipient, addressee or audience;
- d. where not apparent, the role of the author, writer, sender, recipient, addressee or audience, and the relationships between and among such persons;

- e. the date of creation or transmittal indicated on each document, or an estimate of that date, indicated as such;
 - f. whether the claim of privilege or protection applies to the entire contents of the document or only a portion thereof;
 - g. the number of pages in the document;
 - h. the general subject matter of each document; and
 - i. the claimed grounds for limitation of discovery (*e.g.*, “attorney-client privilege”).
4. If any of the documents requested herein have been, but is no longer in your possession, custody or control, or has been lost or destroyed, state the request to which it would be responsive, and describe with particularity the circumstances under which the document or thing was lost or destroyed, including but not limited to the identity of the person or persons responsible for the loss or destruction of each document or thing.
5. If a document is produced in redacted form, state with particularity the reason(s) it was not produced in full, and describe generally those portions of the document that are not being produced in a manner sufficient to identify the document for purposes of a motion to compel discovery.

DOCUMENTS TO BE PRODUCED

1. Any and all **documents and communications relating to the patents-in-suit** and/or to any **related patents or applications** or the technology described therein, including but not limited to **documents and communications relating to** the prosecution of (i) the applications that issued as the **patents-in-suit** and any other applications to which those patents

claim priority, (ii) any foreign counterparts, and (iii) any continuation, continuation-in-part, divisional, reissue, or reexamination application.

2. Any and all **documents** and **communications relating to** ownership, assignment, or chain of title of the **patents-in-suit** and/or of any **related patents or applications**.

3. Any and all **documents** or **communications relating to prior art** for the purported inventions claimed in the **patents-in-suit** and/or in any **related patents or applications**, or to **your** knowledge thereof.

4. Any and all **documents** and **communications referring to** anything that **you** have determined may or does constitute **prior art** to any claim of the **patents-in-suit** and/or to any **related patents or applications** (including, without limitation, any and all material prior art products, systems, uses, patents, publications and/or literature or other **documents**).

5. Any and all **documents** and **communications referring to** anything that any **person** has indicated to **you** may or does constitute **prior art** to any claim of the **patents-in-suit** and/or to any **related patents or applications**.

6. Any and all **documents** and **communications referring to** anything that **you** considered and determined does not constitute **prior art** to any claim of the **patents-in-suit** and/or to any **related patents or applications**.

7. Any and all **documents** and **communications relating to** any accusation, allegation, or other assertion that any accused instrumentality in the **Related Actions** infringes or is covered by any claim of the **patents-in-suit** and/or any **related patents or applications**, including any comparison between any accused instrumentality and claims of the **patents-in-suit**

and/or any **related patents or applications**, or any embodiment described in the **patents-in-suit** and/or any **related patents or applications**.

8. Any and all **documents and communications relating to** any judicial or administrative proceedings involving any of the **patents-in-suit** and/or any **related patents or applications**.

9. Any and all **documents relating to communications** that **you** have had with any **person** about infringement of the **patents-in-suit**, including about any infringement of the **patents-in-suit** by the **Defendants**.

10. Any and all **documents and communications relating to** development, design, conception, reduction to practice, and/or inventorship of the **patents-in-suit**, or of any **related patents or applications**, or of the technology described therein, including but not limited to notebooks and invention disclosure forms.

11. **Documents** sufficient to identify all **persons** who participated in the design or development of every instrumentality that embodies, practices, or employs or is capable of embodying, practicing, or employing the subject matter claimed in the **patents-in-suit** and/or in any **related patents or applications**.

12. Any and all **documents and communications relating to** any explanation of, definition of, or elaboration on the meaning of any of the words in the claims of the **patents-in-suit** and/or in any **related patents or applications**.

13. Any and all **documents and communications relating to** the earliest public use, disclosure, sale, or offer for sale of the technology claimed in the **patents-in-suit** and/or in any

related patents or applications.

14. Any and all **documents** and **communications relating to** the first disclosure by the inventor(s) to any **third party** of any of the inventions described or claimed in the **patents-in-suit** and/or in any **related patents or applications.**

15. Any and all **documents** and **communications relating to** the scope, patentability, construction, validity, invalidity, infringement, non-infringement, enforceability, and/or unenforceability of any claims of the **patents-in-suit** and/or of any **related patents or applications**, including, but not limited to, publications, **prior art**, prior art searches, studies, opinions, investigations, offers for sale, sales, or public uses of or **related** to the subject matter claimed in the **patents-in-suit** and/or in any **related patents or applications.**

16. Any and all **documents** and **communications** that **refer** or **relate to** objective evidence concerning the obviousness or non-obviousness of the subject matter claimed in the **patents-in-suit** and/or in any **related patents or applications**, including, but not limited to, commercial success, long-felt but unsolved need, failure of others, copying, industry recognition, and near simultaneous invention.

17. Any and all **documents** and **communications relating to** actual or proposed agreement(s), license(s) or covenants not to sue concerning the **patents-in-suit** and/or any **related patents or applications.**

18. Any and all **documents** and **communications relating to** any actual or proposed efforts to commercialize the subject matter disclosed and/or claimed in the **patents-in-suit** and/or in any **related patents or applications.**

19. The most recent version of the curriculum vitae of Julie Chovanes.

20. Any and all **documents** and **communications relating to** actual or proposed compensation for **your** participation in any way in any of the **Related Actions**.

21. Any and all agreements and/or **communications** between **you** and **YYZ** or any other YYZ-related entity **relating to** any of the **Related Actions**.

22. **Your** entire file with respect to the **patents-in-suit** and/or any **related patents or applications**.

23. All **documents** concerning any **communications** between or among **you** and any **third parties** concerning the **patents-in-suit** or any **related patents or applications**, or the subject matter disclosed or claimed in such patents and applications, including but not limited to all **documents** and **communications** exchanged between or among **you** and Vincent Cyr, Kenneth Fritz, Dieter Roller, and Matthew Franklin.

(57) **ABSTRACT**

The present invention comprises apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes. A central message repository or database is constructed, comprised of monitoring messages sent from process messaging systems. The database may then be accessed or queried as desired. A simulation tool assists in reviewing present and proposed processes and sub-processes before modifying existent systems or creating new systems.

MEASURING, MONITORING AND TRACKING ENTERPRISE COMMUNICATIONS AND PROCESSES

The present invention relates to apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes. More particularly, the present invention relates to computer-based apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes in an asynchronous messaging environment.

BACKGROUND OF THE INVENTION

The activities of a business or enterprise can be grouped into processes. Processes are business operations that are separated as desired and usually occur across business units. For example, the process of taking orders and turning those orders into revenue may be known as Order to Cash. The processes are comprised of sub-processes. For example, Order to Cash may be broken down into sub-processes such as Receive Order Inquiry, Provide Customer Quotation, Create Customer Outline Agreement, Create Sales Order, Schedule Production, Manufacture Product, Ship Product and Invoice Customer. Each sub-process may in turn be broken down into discrete activities such as providing customer number, entering that customer number, establishing pricing, determining a shipping date, etc.

The processes, sub-processes and activities operate, in part, by communicating information. For example, users may communicate through email. As another example, applications may communicate amongst themselves through electronic data interchange ("EDI") and other similar services. Communication occurs horizontally, that is, among a process, sub-process and activities, as well as vertically, that is, between processes, sub-processes and activities.

Whether communications occur horizontally or vertically, among applications or users, communications are increasingly asynchronous or message based. That is, enterprise communications were formerly primarily synchronous, or connection oriented, in which a connection is established with prior coordination between communication end points with data then being transmitted over the connection. Enterprise communications are now increasingly asynchronous, or connectionless, transmitting data without prior coordination between communication end points, such as through "event based" communications which use messages to move data instead of large files.

Asynchronous or message based communications permit loosely coupled connections among and between systems because the end points do not have to be prepared to receive the data when the message is transmitted. Loosely coupled connections permit more flexibility in assembling processes. Flexibility in assembling processes is desirable in order to permit quick reaction to changing business conditions: if a particular sub-process or activity becomes unusable, the process can be reassembled with a new sub-process or activity. For example, if a Manufacture Product sub-process in the Order to Cash process at Widget Co. enterprise has a specific factory identified to manufacture the product and that factory has a fire or other disaster, making it unusable, Widget Co. will need to substitute a new factory. The ripple effect of that substitution among all of Widget Co.'s processes will change any number of parameters. A loosely coupled asynchronous connection among Widget Co.'s processes provides rapid substitution of the new factory for the old because the end points of communication to the new

2

factory do not have to be predetermined before communications begin with the new factory. Thus, the flexibility of the asynchronous message based communication has permitted quick response to changing business conditions.

Despite this flexibility, asynchronous or message based communications are problematic because of their loosely coupled nature. At any given time, precise information on the progress of the processes is difficult to obtain—messages may be in transit and not instantly locatable. For example, if a customer calls for the status of an order, an enterprise customer service representative may be able to determine nothing more than the fact that the order has been received and that the scheduled ship date is X. There is often no ability to drill down into the information levels and review the status in more granularity, such as the location of the good, the manufacturing status, etc., because the information required to review that status is in transit and unable to be reviewed.

Of course, if the enterprise lacks the ability to access status information, business partners of the enterprise will similarly lack that ability. Thus, asynchronous communications may well increase inefficiency among business partners as well.

The difficulty in reporting caused by message based architecture also makes it difficult for the enterprise to measure the efficiency of its processes and their sub-process. Asynchronous messaging, with its indeterminate transmission of information, means a company may not be able to easily measure the interval between each sub-process, e.g. the time between Scheduling Production and the Manufacturing of a Product, and so easily measure the efficiency of their operations.

Finally, asynchronous messaging may provide an enterprise with an ability to model and simulate processes. That is, since information flows can be readily estimated through enterprises with asynchronous messaging, and processes can be easily modeled from those flows, asynchronous messaging modeling provides the potential to model and simulate processes. That potential is not realized with present technology, however. Moreover, since as described above, enterprises lack information on the processes they have implemented, the enterprises are handicapped in their ability to modify those processes or plan new processes. A modeling and simulation tool, demonstrating processes, sub-processes and their activity or granular detail level would be extremely helpful, and would give the enterprise an opportunity to assemble, test, adjust, and simulate processes and their details.

Accordingly, it is an object of the present invention to provide a tool for simulating message based architectures.

It is a further object of the present invention to provide monitoring capabilities for enterprise processes.

3

SUMMARY OF THE INVENTION

The present invention comprises apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes in an asynchronous messaging environment. For each original message sent within a process, sub-process or activity, the preferred embodiments of the present invention send a separate monitoring message containing data from the central message repository or database. This data may include date, time, customer number, materials, quantity, amount, or other information, and be copied from the original message. Other embodiments may add data to the monitoring message aside from that contained in the original message.

This central message repository or database is comprised of information passing through the enterprise. In effect, the database provides a collection point or an "end point" for the asynchronous communications, and so allows the flexibility of asynchronous communications to be combined with the precision of synchronous communications. The database can be reviewed in any number of ways. For example, the database can be queried to obtain specific information about that particular order or customer or could be examined across larger time spans such as days, weeks, or months, to gauge trends or performance. Of course, some preferred embodiments may wish to create mirror databases or other databases that can be used in various ways.

An enterprise's information flow can also be readily modeled and simulated through creating new process, sub-process and/or activities or altering existing process, sub-process or activities. The information flows from those creations or alterations can be collected in one or more databases and examined as desired.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

FIG. 1 shows a sample process, Order to Cash, which is comprised of various sub-processes: Receive Order Inquiry, Provide Customer Quotation, Create Customer Outline Agreement, Create Sales Order, Schedule Production, Manufacture Product, Ship Product and Invoice Customer. The dashed line arrows connecting the sub-processes are the communication paths between the sub-processes. In the example shown in the figure, the sub-processes actually communicate through a messaging broker, such as an IBM MQSeries component, and the paths to and from the component are identified identically. This messaging broker permits certain sophisticated messaging uses, such as message queuing, some data translation, etc.

A messaging component is added to the messaging broker, through methods known in the art. This messaging component creates a "monitoring" message for each original message received by the broker. This monitoring message contains, in this embodiment, specific data generated from the original messages passing between the sub-processes. The monitoring message with its data is then sent from the messaging broker to a central database repository or database (the terms "repository" or "database" are used interchangeably throughout.)

The messaging component may be, in some embodiments, or may not be, in other embodiments, provided by the messaging broker. For example, IBM's MQSeries messaging broker provides a component that can be configured to perform a copying function for the messages it receives, and so create monitoring messages for the messages it receives.

4

The specific data contained in the monitoring messages (in this embodiment, generated from the original messages passing between the sub-processes) is organized into data fields. Those data fields are path specific in this embodiment.

For example, assume a customer calls the enterprise (Widget Co.) whose process is shown in FIG. 1 and asks whether or not Widget Co. has a certain product (Type A Widgets.) That customer request will begin the Receive Order Inquiry sub-process which will end with the generation of a Receive Order Inquiry message traveling to the Provide Customer Quotation sub-process through the messaging broker component. When the messaging broker receives the message on Path A, it will create a monitoring message, and send the monitoring message to the central database repository, as shown in FIG. 2. In this embodiment, the data contained in the monitoring message is generated from the message on Path A. Other preferred embodiments may alter or add data to the monitoring messages aside from that contained in the original message.

The monitoring message contains, in this embodiment, specific data fields. (Of course, other embodiments may have different data fields.) Those data fields are:

25	FIELDS	IDENTIFIERS
	PROCESS IDENTIFIER	ProID,
	SUB-PROCESS IDENTIFIER	SbProID,
	CUSTOMER NUMBER	Custno,
30	PART NUMBER	Partno,
	QUANTITY	Qty,
	DATE	Date,
	TIME	Time

The first field, the PROCESS IDENTIFIER field, provides the identifier for the process, for example, the value "Order to Cash" because the monitoring message is being created within the Order to Cash process. The second field, the SUB-PROCESS IDENTIFIER field, provides the identifier for the sub-process, for example, the value "Inquiry" because the monitoring message is being created within the Inquiry sub-process. This embodiment prepopulates these PROCESS IDENTIFIER and SUB-PROCESS IDENTIFIER fields, with the appropriate values.

The CUSTOMER NUMBER field is assigned to the particular customer generating the inquiry. The PART NUMBER field is the identifier for the particular part and the QUANTITY for the particular quantity. DATE and TIME are the data and time the message is generated. Other message fields for other paths of this embodiment are shown in Table 1. Of course, some, all or none of these fields may be present in other embodiments, as well as other fields as desired. For example, one or more ACTIVITY IDENTIFIER fields may be present in monitoring messages in other embodiments.

The monitoring message data populates one information flow or transaction record ("transaction record.") As monitoring messages progress through any given process and/or sub-process, the transaction record is updated. Once the monitoring messages complete the transaction record, all of the information needed to measure that transaction through the process is contained in one record in the central message database. (Of course, if the monitoring messages do not fully populate the transaction record, e.g., the transaction is aborted in mid process, then these abandoned records may be made available as well with an indication that they were abandoned.)

US 7,062,749 B2

5

The central message database can be reviewed in any number of ways, in order to measure, monitor and track enterprise communications and processes, e.g., to provide information or generate reports. Using the central message database to provide information or generate reports “off loads” the information access or reporting processes from the applications that generate messages initially, e.g., sub-processes such as those seen in FIG. 1. This off loading relieves some of the monitoring pressure from the source applications so that, for example, any queries that might have been made to the source applications and interfere with or slow down the operation of the source applications can now be made through the central message database.

The information retrieved from the central message database may include, but is not limited to, information about any particular order or customer, information about process efficiency, “snapshot” or time slice information, information across time spans such as days, weeks, or months, information to gauge trends or performance, etc. Also, in some embodiments, a “real-time” tool may be used to track the progress of transaction records and/or processes and use distribution methods such as broadcasting, WAP, etc. to provide the information to users. For example, if a process such as pipeline capacity for oil and natural gas transmissions is implemented and monitored through an embodiment of the present invention, the central message database will constantly broadcast unused pipeline capacity, which information in turn can be used to sell, trade or barter that unused capacity. As another example, information about an enterprise’s processes can be made available over an intranet, extranet, the Internet, etc. to business partners or other entities. One example would be providing information to stock analysts so that they could track any particular enterprise’s productivity or other areas of interest. Another example would be providing information to actual or potential business partners to check production capacity, shipping capacity, or other areas of interest. In some embodiments, with regard to external entities, communication channels between the external entities and the enterprise might well be established, so that central message databases exist on both ends of the communication channel.

The central message database allows for broader analysis of trends that may include: time between sub-processes, variances by customer, variances by order amount, bottlenecks in the process, etc. For example, it would be possible to determine how many orders stood between Order and Invoice. This may allow for the acceleration of some orders so they could be booked by quarter close. For example, a vendor bottleneck may be identified in the course of review of the processes, sub-processes and/or activities. For example, seasonal variations in processes, sub-processes and/or activities may be identified as well.

Of course, some embodiments may create mirror databases and/or generate other databases that can be used by various entities. For example, an enterprise may create a number of central message databases which could track processes, sub-processes and/or activities in whole or part. These databases could also be combined as desired.

Monitoring message database(s) may be used, in some embodiments, in various ways, either in addition to or instead of central message database(s.) For example, a monitoring message database or a central message database may be used to generate messages and feedback to the processes, sub-processes, activities and/or applications, as well as to users and/or administrators (herein generally “users.”) Various messages transmitted from sub-process applications such as error messages would generate special

6

monitoring messages which would be added to a message monitoring database. Other events, exceptions, triggers and thresholds, could be tracked as well in various embodiments and be used to signal conditions, problems, etc. by various methods such as “flagged” or specially designated messages or other indicators.

Access to the database(s) is, in the preferred embodiments, on a secured or authorized basis, with different users obtaining different levels of access to the data in the database.

FIG. 3 shows a screen shot of an example of a preferred embodiment where access was made available to a customer over a corporate extranet. The screen shot is of a report, generated through an XML link to the central message database, of that particular customer’s orders. In the preferred embodiments, the customer has the option to “drill down” through this screen to other screens for further detail. So, for example, FIG. 4 shows a result of one such operation, where the customer had drilled down from the screen of FIG. 3. Of course, these records may vary depending on the status of the transaction, that is, whether the transaction is in the middle of the process, at the beginning of the process, etc. Furthermore, other reporting options may be seen depending on the embodiments. Additionally, in some embodiments the user may have the option to drill down further into or past these levels if desired.

The preferred embodiments of the present invention also provide a simulation module for business processes. The simulation module makes possible simulation of new processes, their sub-processes and the activities that make up the sub-processes. This provides the enterprise or other user with the opportunity to assemble, test, adjust, and simulate processes before they are integrated into the enterprise.

The simulation module of the preferred embodiments provides the ability to assemble simulated processes in two primary ways. The first primary way is through provision of a toolkit or palette of predetermined sub-processes to the user. The user can then choose from that palette of sub-processes to form a process for an organization, which is then used in the simulation as is explained in further detail below.

The second primary method of assembling processes is to provide the user with activities, which are the most granular construct of a sub-process. Additionally, more sophisticated users will be given the opportunity to assemble their own activities. Either or both options of this second primary method can be offered in various embodiments. Additionally, the first and second primary methods can be combined in certain embodiments as well.

The preferred embodiments permit use of discrete activities among sub-processes, perhaps in an object oriented format, in order to save time and increase productivity. These activities can then be connected to form one or more sub-processes, which in turn can be connected to form one or more processes. The ability to create additional sub-processes would allow for the company to add their unique sub-processes to the palette.

It should be noted that in other embodiments, the simulation module may be constructed in other ways. For example, preconfigured, industry-specific processes may be supplied that can be altered and/or provided with enterprise specifics.

The simulation model is contained, in the preferred embodiments, on a corporate intranet or extranet. The underlying assumption of the simulation model in the preferred embodiments is that the completion of each sub-process will generate a message. So, for example, if a process such as that

US 7,062,749 B2

7

of FIG. 1 is simulated, the completion of the first sub-process will generate a message to be sent to the next sub-process, the completion of the next sub-process will generate a message that will be sent to the next sub-process, and so on.

FIG. 5 shows a process development environment screen for an example process called "Order" of the simulation module. Sub-processes Inquiry, Quote, Agreement, Order, Schedule, Manufacture, Ship and Invoice have been joined together to comprise this process. The sub-processes, in this example, are predetermined and their activities are predetermined. The input and output queue names are identified where appropriate. For example, the output queue name in the Inquiry sub-process is INQUIRY_OUT. That output queue then feeds data into the input queue of the Quote sub-process. (These are analogous to Path A in FIG. 1.) The base delay provides the initial time of a sub-process. For example, the base delay for the Quote Sub-process is 1 or a time increment of 1. In contrast the Manufacture Sub-process base delay is 48, so that the time increment for the Manufacture Sub-process is 48. The Current Variation shows the Increase/Decrease Variation set by the slider, permitting an increase or decrease in the latency per process and thus permits the user to see the downstream effect of altering each sub-process time. (Other embodiments may use different apparatus and methods as known in the art to vary the latency of the sub-process.) In this example, the total time of the process is obtained by adding each base delay of each sub-process, however, each sub-process may not affect the other in a geometric or logarithmic progression. For example, varying the base delay by one time increment of the Quote sub-process may not lead to an exact one time increment variation in the Scheduling sub-process.

FIGS. 6 through 9 are examples of tools that are used in this embodiment to construct sub-process modules such as those used in FIG. 5. For example, FIG. 6 shows the properties of the Agreement sub-process module, which are the process, the sub-process and the application used in the sub-process. The process and sub-process are predetermined in this module. The user has the option of setting the application alternative of the sub-process to one or more predetermined alternatives. These alternatives would be used, for example, when a new application might be used to provide output from the sub-process.

FIG. 7 shows a message queue construction tool for the sub-process identified in FIG. 6. This tool, which may be another option combined with the process tool of FIG. 6 or some other tool in various embodiments, or may be stand-alone in other embodiments, provides the ability to select a queue manager (a process that manages different message queues in various machines or applications), input queue and output queue for the particular sub-process being simulated. Each of these options, queue manager, input queue and output queue, can be changed by using the arrows to access a drop-down menu of predetermined alternatives. Once the alternatives are chosen, the module can be saved. Of course, in other embodiments non-predetermined alternatives may be used.

FIG. 8 shows an application construction tool, which can be used to select the applications used on either end of the queue or path. Here, there are two separate targets, one external, with a single monitoring message being sent to a central message database, before the source message is split and sent to both target applications. FIG. 9 shows the particular data fields or points that may be captured in the monitoring message. These are selected by highlighting the preferred fields in this embodiment.

8

Other alternatives are possible for other embodiments of the simulation module. For example, the embodiments discussed above have some alternatives as predetermined, which makes the construction of sub-process modules more convenient. In other embodiments non-predetermined alternatives may be used. Moreover, any desired processes that are not defined in predetermined modules can be developed and made available to the user. For example, a tool such as that shown in FIG. 10 provides the ability to alter the process, the sub-process, and the application, by using the arrows to access a drop-down menu of predetermined alternatives, thus facilitating creation of new processes, sub-processes and/or activities. Other embodiments may use an "open ended" format to allow the creation of new processes and sub-processes and/or activities.

The simulation module is, in the preferred embodiments, either stand-alone or contained as part of a monitoring apparatus and/or system as had been described above. If the latter, then "real-time" data and processes, sub-processes and activities can be used in the simulation apparatus and/or process. The simulator module permits processes and sub-processes to be defined, simulated, and refined before modifying existent systems or implementing new systems.

The above description and the views and material depicted by the figures are for purposes of illustration only and are not intended to be, and should not be construed as, limitations on the invention.

Moreover, certain modifications or alternatives may suggest themselves to those skilled in the art upon reading of this specification, all of which are intended to be within the spirit and scope of the present invention as defined in the attached claims.

We claim:

1. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message;

wherein said original message data comprises the status of an activity.

2. A method as in claim 1 further comprising reviewing data collected in said transaction record.

3. A method as in claim 1 wherein said original message data comprises at least one field of data selected from the group consisting of date data, time data, customer number data, materials data, quantity data and amount data.

10

4. A method as in claim 1 wherein said original message data comprises at least one field selected from the group consisting of PROCESS IDENTIFIER, SUB-PROCESS IDENTIFIER, ACTIVITY IDENTIFIER, CUSTOMER NUMBER, PART NUMBER, QUANTITY, DATE and TIME.

5. A method as in claim 1 wherein said original message data comprises at least one field selected from the group consisting of ProID, SbProID, Custno, Partno, Qty, Date and Time.

6. A method as in claim 1 further comprising providing the status of a process by providing access to said central message repository.

7. A method as in claim 1 further comprising adding, to said monitoring message, data other than said original message data.

8. A method as in claim 1 further comprising updating said transaction record.

9. A method as in claim 8 further comprising updating said transaction record by:

providing, through a second monitoring message, a second original message data to said transaction record; and,

populating said transaction record with said second original message data provided by said second monitoring message.

10. A method as in claim 1 further comprising completing a process.

11. A method as in claim 10 further comprising completing said transaction record.

12. A method as in claim 1 further comprising aborting a process.

13. A method as in claim 12 further comprising providing, in said transaction record, an indication that the record has been abandoned.

14. A central message repository created by the method of claim 1.

15. A transaction record created by the method of claim 1.

16. A method as in claim 1 wherein said status of a process is a simulated process.

17. A method as in claim 1 wherein said original message data is simulated original message data.

18. A method as in claim 1 further comprising providing the status of a sub process by providing access to said central message repository.

19. A method as in claim 1 further comprising providing the status of an activity by providing access to said central message repository.

20. A method as in claim 1 wherein said status of a sub process is a simulated process.

21. A method as in claim 1 wherein said status of an activity is a simulated process.

22. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

monitoring a process, which is comprised of at least a first and second sub process, by generating original message data from each of said first and second sub process;

transmitting said original message data from said first sub process, via a first monitoring message, to a central message repository;

storing said original message data from said first sub process, in a transaction record in said central message repository;

US 7,062,749 B2

11

transmitting said original message data from said second sub process, via a second monitoring message, to said central message repository; and, storing said original message data from said second sub process, in said transaction record in said central message repository; wherein said original message data comprises the status of said sub processes.

23. A method as in claim 22 further comprising determining the status of said process.

24. A method as in claim 22 wherein said original message data from each of said first and second sub processes comprises a sub process specific set of data.

25. A method as in claim 22 wherein said first monitoring message further comprises altered original message data.

26. A method as in claim 22 wherein said first monitoring message further comprises data added to said original message data.

27. A method as in claim 22 further comprising reviewing said central message repository.

28. A method as in claim 27 wherein reviewing said central message repository further comprises reviewing information from the group consisting of order information, customer information, process efficiency information, snapshot information, time slice information, daily information, weekly information, monthly information, trend information and performance information.

29. A method as in claim 22 further comprising distributing process progress information in real time.

30. A method as in claim 29 further comprising distributing said process progress information through broadcasting.

31. A method as in claim 29 further comprising distributing said process progress information through the Internet.

32. A method as in claim 29 further comprising distributing said process progress information through Wireless Application Protocol.

33. A method as in claim 29 further comprising distributing said process progress information through an intranet.

34. A method as in claim 29 further comprising distributing said process progress information through an extranet.

35. A method as in claim 22 further comprising analyzing said central message repository in order to determine a process trend.

36. A method as in claim 35 wherein said process trend is selected from the group consisting of: time between sub-processes, variances by customer, variances by order amount, bottlenecks and seasonal variations.

37. A method as in claim 36 wherein orders may be accelerated as a result of said analysis.

38. A method as in claim 22 further comprising providing a monitoring message database.

39. A method as in claim 22 further comprising providing a report via an XML link to said central message repository.

40. A method as in claim 22 wherein said second monitoring message further comprises altered original message data.

41. A method as in claim 22 wherein said second monitoring message further comprises data added to said original message data.

42. An apparatus for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

means for providing, through a monitoring message, at least part of said original message data to a central message repository;

12

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message; wherein said original message data comprises the status of a.

43. An apparatus as in claim 42 further comprising means for reviewing data collected in said transaction record.

44. An apparatus as in claim 42 further comprising means for broadcasting data collected in said transaction record.

45. An apparatus as in claim 42 further comprising means for providing the status of a process by providing access to said central message repository.

46. An apparatus as in claim 42 further comprising means for adding, to said monitoring message, data other than said original message data.

47. An apparatus as in claim 42 further comprising means for providing the status of a sub process by providing access to said central message repository.

48. An apparatus as in claim 42 further comprising means for providing the status of an activity by providing access to said central message repository.

49. An apparatus for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

means for monitoring a process, which is comprised of at least a first and second sub process, by generating original message data from each of said first and second sub process;

means for transmitting said original message data from said first sub process, via a first monitoring message, to a central message repository;

means for storing said original message data from said first sub process, in a transaction record in said central message repository;

means for transmitting said original message data from said second sub process, via a second monitoring message, to said central message repository; and,

means for storing said original message data from said second sub process, in said transaction record in said central message repository;

wherein said original message data comprises the status of said sub processes.

50. An apparatus as in claim 49 further comprising means for reviewing said central message repository.

51. An apparatus as in claim 49 further comprising means for distributing process progress information through broadcasting.

52. An apparatus as in claim 49 further comprising means for providing a monitoring message database.

53. An apparatus as in claim 49 further comprising means for providing a report via an XML link to said central message repository.

54. An apparatus as in claim 49 further comprising means for distributing said process progress information through Wireless Application Protocol.

55. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message;

US 7,062,749 B2

13

wherein said original message data comprises the status of a process.

56. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising: 5

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message; 10

wherein said original message data comprises the status of a sub process.

57. An apparatus for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising: 15

means for providing, through a monitoring message, at least part of said original message data to a central message repository; 20

14

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message;

wherein said original message data comprises the status of a sub process.

58. An apparatus for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

means for providing, through a monitoring message, at least part of said original message data to a central message repository;

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message;

wherein said original message data comprises the status of an activity.

APPARATUS AND SYSTEMS FOR MEASURING, MONITORING, TRACKING AND SIMULATING ENTERPRISE COMMUNICATIONS AND PROCESSES

CROSS REFERENCE TO RELATED APPLICATION

This application is a continuation of and claims the benefit of U.S. patent application Ser. No. 09/737,494 filed Dec. 15, 2000, entitled Apparatus and Methods for Isolating and Reviewing Data from Multiple Sources, now issued U.S. Pat. No. 7,062,749.

The present invention relates to apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes. More particularly, the present invention relates to computer-based apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes in an asynchronous messaging environment.

BACKGROUND OF THE INVENTION

The activities of a business or enterprise can be grouped into processes. Processes are business operations that are separated as desired and usually occur across business units. For example, the process of taking orders and turning those orders into revenue may be known as Order to Cash. The processes are comprised of sub-processes. For example, Order to Cash may be broken down into sub-processes such as Receive Order Inquiry, Provide Customer Quotation, Create Customer Outline Agreement, Create Sales Order, Schedule Production, Manufacture Product, Ship Product and Invoice Customer. Each sub-process may in turn be broken down into discrete activities such as providing customer number, entering that customer number, establishing pricing, determining a shipping date, etc.

The processes, sub-processes and activities operate, in part, by communicating information. For example, users may communicate through email. As another example, applications may communicate amongst themselves through electronic data interchange ("EDI") and other similar services. Communication occurs horizontally, that is, among a process, sub-process and activities, as well as vertically, that is, between processes, sub-processes and activities.

Whether communications occur horizontally or vertically, among applications or users, communications are increasingly asynchronous or message based. That is, enterprise communications were formerly primarily synchronous, or connection oriented, in which a connection is established with prior coordination between communication end points with data then being transmitted over the connection. Enterprise communications are now increasingly asynchronous, or connectionless, transmitting data without prior coordination between communication end points, such as through "event based" communications which use messages to move data instead of large files.

Asynchronous or message based communications permit loosely coupled connections among and between systems because the end points do not have to be prepared to receive the data when the message is transmitted. Loosely coupled connections permit more flexibility in assembling processes. Flexibility in assembling processes is desirable in order to permit quick reaction to changing business conditions: if a particular sub-process or activity becomes unusable, the process can be reassembled with a new sub-process or activity. For example, if a Manufacture Product sub-process in the

2

Order to Cash process at Widget Co. enterprise has a specific factory identified to manufacture the product and that factory has a fire or other disaster, making it unusable, Widget Co. will need to substitute a new factory. The ripple effect of that substitution among all of Widget Co.'s processes will change any number of parameters. A loosely coupled asynchronous connection among Widget Co.'s processes provides rapid substitution of the new factory for the old because the end points of communication to the new factory do not have to be predetermined before communications begin with the new factory. Thus, the flexibility of the asynchronous message based communication has permitted quick response to changing business conditions.

Despite this flexibility, asynchronous or message based communications are problematic because of their loosely coupled nature. At any given time, precise information on the progress of the processes is difficult to obtain—messages may be in transit and not instantly locatable. For example, if a customer calls for the status of an order, an enterprise customer service representative may be able to determine nothing more than the fact that the order has been received and that the scheduled ship date is X. There is often no ability to drill down into the information levels and review the status in more granularity, such as the location of the good, the manufacturing status, etc., because the information required to review that status is in transit and unable to be reviewed.

Of course, if the enterprise lacks the ability to access status information, business partners of the enterprise will similarly lack that ability. Thus, asynchronous communications may well increase inefficiency among business partners as well.

The difficulty in reporting caused by message based architecture also makes it difficult for the enterprise to measure the efficiency of its processes and their sub-process. Asynchronous messaging, with its indeterminate transmission of information, means a company may not be able to easily measure the interval between each sub-process, e.g. the time between Scheduling Production and the Manufacturing of a Product, and so easily measure the efficiency of their operations.

Finally, asynchronous messaging may provide an enterprise with an ability to model and simulate processes. That is, since information flows can be readily estimated through enterprises with asynchronous messaging, and processes can be easily modeled from those flows, asynchronous messaging modeling provides the potential to model and simulate processes. That potential is not realized with present technology, however. Moreover, since as described above, enterprises lack information on the processes they have implemented, the enterprises are handicapped in their ability to modify those processes or plan new processes. A modeling and simulation tool, demonstrating processes, sub-processes and their activity or granular detail level would be extremely helpful, and would give the enterprise an opportunity to assemble, test, adjust, and simulate processes and their details.

Accordingly, it is an object of the present invention to provide a tool for simulating message based architectures.

It is a further object of the present invention to provide monitoring capabilities for enterprise processes.

 FIG. 10 shows a partial view of a preferred embodiment.

SUMMARY OF THE INVENTION

The present invention comprises apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes in an asynchronous messaging environment. For each original message sent within a process, sub-process or activity, the preferred embodiments of the present invention send a separate monitoring message containing data from the central message repository or database. This data may include date, time, customer number, materials, quantity, amount, or other information, and be copied from the original message. Other embodiments may add data to the monitoring message aside from that contained in the original message.

This central message repository or database is comprised of information passing through the enterprise. In effect, the database provides a collection point or an "end point" for the asynchronous communications, and so allows the flexibility of asynchronous communications to be combined with the precision of synchronous communications. The database can be reviewed in any number of ways. For example, the database can be queried to obtain specific information about that particular order or customer or could be examined across larger time spans such as days, weeks, or months, to gauge trends or performance. Of course, some preferred embodiments may wish to create mirror databases or other databases that can be used in various ways.

An enterprise's information flow can also be readily modeled and simulated through creating new process, sub-process and/or activities or altering existing process, sub-process or activities. The information flows from those creations or alterations can be collected in one or more databases and examined as desired.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

FIG. 1 shows a sample process, Order to Cash, which is comprised of various sub-processes: Receive Order Inquiry, Provide Customer Quotation, Create Customer Outline Agreement, Create Sales Order, Schedule Production, Manufacture Product, Ship Product and Invoice Customer. The dashed line arrows connecting the sub-processes are the communication paths between the sub-processes. In the example shown in the figure, the sub-processes actually communicate through a messaging broker, such as an IBM MQSeries component, and the paths to and from the component are identified identically. This messaging broker permits certain sophisticated messaging uses, such as message queuing, some data translation, etc.

A messaging component is added to the messaging broker, through methods known in the art. This messaging component creates a "monitoring" message for each original message received by the broker. This monitoring message contains, in this embodiment, specific data generated from the original messages passing between the sub-processes. The monitoring message with its data is then sent from the messaging broker to a central database repository or database (the terms "repository" or "database" are used interchangeably throughout.)

The messaging component may be, in some embodiments, or may not be, in other embodiments, provided by the mes-

4

saging broker. For example, IBM's MQSeries messaging broker provides a component that can be configured to perform a copying function for the messages it receives, and so create monitoring messages for the messages it receives.

The specific data contained in the monitoring messages (in this embodiment, this data is copied from the original messages passing between the sub-processes) is organized into data fields. Those data fields are path specific in this embodiment. For example, assume a customer calls the enterprise (Widget Co.) whose process is shown in FIG. 1 and asks whether or not Widget Co. has a certain product (Type A Widgets.) That customer request will begin the Receive Order Inquiry sub-process which will end with the generation of a Receive Order Inquiry message traveling to the Provide Customer Quotation sub-process through the messaging broker component. When the messaging broker receives the message on Path A, it will create a monitoring message, and send the monitoring message to the central database repository, as shown in FIG. 2. In this embodiment, the data contained in the monitoring message is generated from the message on Path A. Other preferred embodiments may alter or add data to the monitoring messages aside from that contained in the original message.

The monitoring message contains, in this embodiment, specific data fields. (Of course, other embodiments may have different data fields.) Those data fields are:

30	FIELDS	IDENTIFIERS
	PROCESS IDENTIFIER	ProID,
	SUB-PROCESS IDENTIFIER	SbProID,
	CUSTOMER NUMBER	Custno,
	PART NUMBER	Partno,
	QUANTITY	Qty,
	DATE	Date,
	TIME	Time

The first field, the PROCESS IDENTIFIER field, provides the identifier for the process, for example, the value "Order to Cash" because the monitoring message is being created within the Order to Cash process. The second field, the SUB-PROCESS IDENTIFIER field, provides the identifier for the sub-process, for example, the value "Inquiry" because the monitoring message is being created within the Inquiry sub-process. This embodiment prepopulates these PROCESS IDENTIFIER and SUB-PROCESS IDENTIFIER fields, with the appropriate values.

The CUSTOMER NUMBER field is assigned to the particular customer generating the inquiry. The PART NUMBER field is the identifier for the particular part and the QUANTITY for the particular quantity. DATE and TIME are the data and time the message is generated. Other message fields for other paths of this embodiment are shown in Table 1. Of course, some, all or none of these fields may be present in other embodiments, as well as other fields as desired. For example, one or more ACTIVITY IDENTIFIER fields may be present in monitoring messages in other embodiments.

The monitoring message data populates one information flow or transaction record ("transaction record.") As monitoring messages progress through any given process and/or sub-process, the transaction record is updated. Once the monitoring messages complete the transaction record, all of the information needed to measure that transaction through the process is contained in one record in the central message database. (Of course, if the monitoring messages do not fully populate the transaction record, e.g., the transaction is

US 7,603,674 B2

5

aborted in mid process, then these abandoned records may be made available as well with an indication that they were abandoned.)

The central message database can be reviewed in any number of ways, in order to measure, monitor and track enterprise communications and processes, e.g., to provide information or generate reports. Using the central message database to provide information or generate reports “off loads” the information access or reporting processes from the applications that generate messages initially, e.g., sub-processes such as those seen in FIG. 1. This off loading relieves some of the monitoring pressure from the source applications so that, for example, any queries that might have been made to the source applications and interfere with or slow down the operation of the source applications can now be made through the central message database.

The information retrieved from the central message database may include, but is not limited to, information about any particular order or customer, information about process efficiency, “snapshot” or time slice information, information across time spans such as days, weeks, or months, information to gauge trends or performance, etc. Also, in some embodiments, a “real-time” tool may be used to track the progress of transaction records and/or processes and use distribution methods such as broadcasting, WAP, etc. to provide the information to users. For example, if a process such as pipeline capacity for oil and natural gas transmissions is implemented and monitored through an embodiment of the present invention, the central message database will constantly broadcast unused pipeline capacity, which information in turn can be used to sell, trade or barter that unused capacity. As another example, information about an enterprise’s processes can be made available over an intranet, extranet, the Internet, etc. to business partners or other entities. One example would be providing information to stock analysts so that they could track any particular enterprise’s productivity or other areas of interest. Another example would be providing information to actual or potential business partners to check production capacity, shipping capacity, or other areas of interest. In some embodiments, with regard to external entities, communication channels between the external entities and the enterprise might well be established, so that central message databases exist on both ends of the communication channel.

The central message database allows for broader analysis of trends that may include: time between sub-processes, variances by customer, variances by order amount, bottlenecks in the process, etc. For example, it would be possible to determine how many orders stood between Order and Invoice. This may allow for the acceleration of some orders so they could be booked by quarter close. For example, a vendor bottleneck may be identified in the course of review of the processes, sub-processes and/or activities. For example, seasonal variations in processes, sub-processes and/or activities may be identified as well.

Of course, some embodiments may create mirror databases and/or generate other databases that can be used by various entities. For example, an enterprise may create a number of central message databases which could track processes, sub-processes and/or activities in whole or part. These databases could also be combined as desired.

Monitoring message database(s) may be used, in some embodiments, in various ways, either in addition to or instead of central message database(s.) For example, a monitoring message database or a central message database may be used to generate messages and feedback to the processes, sub-processes, activities and/or applications, as well as to users

6

and/or administrators (herein generally “users.”) Various messages transmitted from sub-process applications such as error messages would generate special monitoring messages which would be added to a message monitoring database. Other events, exceptions, triggers and thresholds, could be tracked as well in various embodiments and be used to signal conditions, problems, etc. by various methods such as “flagged” or specially designated messages or other indicators.

Access to the database(s) is, in the preferred embodiments, on a secured or authorized basis, with different users obtaining different levels of access to the data in the database.

FIG. 3 shows a screen shot of an example of a preferred embodiment where access was made available to a customer over a corporate extranet. The screen shot is of a report, generated through an XML link to the central message database, of that particular customer’s orders. In the preferred embodiments, the customer has the option to “drill down” through this screen to other screens for further detail. So, for example, FIG. 4 shows a result of one such operation, where the customer had drilled down from the screen of FIG. 3. Of course, these records may vary depending on the status of the transaction, that is, whether the transaction is in the middle of the process, at the beginning of the process, etc. Furthermore, other reporting options may be seen depending on the embodiments. Additionally, in some embodiments the user may have the option to drill down further into or past these levels if desired.

The preferred embodiments of the present invention also provide a simulation module for business processes. The simulation module makes possible simulation of new processes, their sub-processes and the activities that make up the sub-processes. This provides the enterprise or other user with the opportunity to assemble, test, adjust, and simulate processes before they are integrated into the enterprise.

The simulation module of the preferred embodiments provides the ability to assemble simulated processes in two primary ways. The first primary way is through provision of a toolkit or palette of predetermined sub-processes to the user. The user can then choose from that palette of sub-processes to form a process for an organization, which is then used in the simulation as is explained in further detail below.

The second primary method of assembling processes is to provide the user with activities, which are the most granular construct of a sub-process. Additionally, more sophisticated users will be given the opportunity to assemble their own activities. Either or both options of this second primary method can be offered in various embodiments. Additionally, the first and second primary methods can be combined in certain embodiments as well.

The preferred embodiments permit use of discrete activities among sub-processes, perhaps in an object oriented format, in order to save time and increase productivity. These activities can then be connected to form one or more sub-processes, which in turn can be connected to form one or more processes. The ability to create additional sub-processes would allow for the company to add their unique sub-processes to the palette.

It should be noted that in other embodiments, the simulation module may be constructed in other ways. For example, preconfigured, industry-specific processes may be supplied that can be altered and/or provided with enterprise specifics.

The simulation model is contained, in the preferred embodiments, on a corporate intranet or extranet. The underlying assumption of the simulation model in the preferred embodiments is that the completion of each sub-process will generate a message. So, for example, if a process such as that

US 7,603,674 B2

7

of FIG. 1 is simulated, the completion of the first sub-process will generate a message to be sent to the next sub-process, the completion of the next sub-process will generate a message that will be sent to the next sub-process, and so on.

FIG. 5 shows a process development environment screen for an example process called "Order" of the simulation module. Sub-processes Inquiry, Quote, Agreement, Order, Schedule, Manufacture, Ship and Invoice have been joined together to comprise this process. The sub-processes, in this example, are predetermined and their activities are predetermined. The input and output queue names are identified where appropriate. For example, the output queue name in the Inquiry sub-process is INQUIRY_OUT. That output queue then feeds data into the input queue of the Quote sub-process. (These are analogous to Path A in FIG. 1.) The base delay provides the initial time of a sub-process. For example, the base delay for the Quote Sub-process is 1 or a time increment of 1. In contrast the Manufacture Sub-process base delay is 48, so that the time increment for the Manufacture Sub-process is 48. The Current Variation shows the Increase/Decrease Variation set by the slider, permitting an increase or decrease in the latency per process and thus permits the user to see the downstream effect of altering each sub-process time. (Other embodiments may use different apparatus and methods as known in the art to vary the latency of the sub-process.) In this example, the total time of the process is obtained by adding each base delay of each sub-process, however, each sub-process may not affect the other in a geometric or logarithmic progression. For example, varying the base delay by one time increment of the Quote sub-process may not lead to an exact one time increment variation in the Scheduling sub-process.

FIGS. 6 through 9 are examples of tools that are used in this embodiment to construct sub-process modules such as those used in FIG. 5. For example, FIG. 6 shows the properties of the Agreement sub-process module, which are the process, the sub-process and the application used in the sub-process. The process and sub-process are predetermined in this module. The user has the option of setting the application alternative of the sub-process to one or more predetermined alternatives. These alternatives would be used, for example, when a new application might be used to provide output from the sub-process.

FIG. 7 shows a message queue construction tool for the sub-process identified in FIG. 6. This tool, which may be another option combined with the process tool of FIG. 6 or some other tool in various embodiments, or may be stand-alone in other embodiments, provides the ability to select a queue manager (a process that manages different message queues in various machines or applications), input queue and output queue for the particular sub-process being simulated. Each of these options, queue manager, input queue and output queue, can be changed by using the arrows to access a drop-down menu of predetermined alternatives. Once the alternatives are chosen, the module can be saved. Of course, in other embodiments non-predetermined alternatives may be used.

FIG. 8 shows an application construction tool, which can be used to select the applications used on either end of the queue or path. Here, there are two separate targets, one external, with a single monitoring message being sent to a central message database, before the source message is split and sent to both target applications. FIG. 9 shows the particular data fields or points that may be captured in the monitoring message. These are selected by highlighting the preferred fields in this embodiment.

Other alternatives are possible for other embodiments of the simulation module. For example, the embodiments discussed above have some alternatives as predetermined, which

8

makes the construction of sub-process modules more convenient. In other embodiments non-predetermined alternatives may be used. Moreover, any desired processes that are not defined in predetermined modules can be developed and made available to the user. For example, a tool such as that shown in FIG. 10 provides the ability to alter the process, the sub-process, and the application, by using the arrows to access a drop-down menu of predetermined alternatives, thus facilitating creation of new processes, sub-processes and/or activities. Other embodiments may use an "open ended" format to allow the creation of new processes and sub-processes and/or activities.

The simulation module is, in the preferred embodiments, either stand-alone or contained as part of a monitoring apparatus and/or system as had been described above. If the latter, then "real-time" data and processes, sub-processes and activities can be used in the simulation apparatus and/or process. The simulator module permits processes and sub-processes to be defined, simulated, and refined before modifying existent systems or implementing new systems.

The above description and the views and material depicted by the figures are for purposes of illustration only and are not intended to be, and should not be construed as, limitations on the invention.

Moreover, certain modifications or alternatives may suggest themselves to those skilled in the art upon reading of this specification, all of which are intended to be within the spirit and scope of the present invention as defined in the attached claims.

We claim:

1. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message wherein said original message data comprises status information of at least one action selected from the group consisting of activity, sub process and process; and,

retrieving information from the central message repository.

2. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information about an order from the central message repository.

10

3. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information about a customer from the central message repository.

4. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving process efficiency information from the central message repository.

5. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving time slice information from the central message repository.

6. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information across a time span from the central message repository.

7. A method as in claim 6 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

8. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information to gauge trends from the central message repository.

9. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information to gauge performance from the central message repository.

10. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information across a time span from the central message repository to gauge trends.

11. A method as in claim 10 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

12. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information across a time span from the central message repository to gauge performance.

13. A method as in claim 12 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

14. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information about process efficiency.

15. A method as in claim 1 wherein said original message data comprises a data field.

16. A method as in claim 15 wherein said data field is path specific.

17. A method as in claim 1 wherein said original message data is generated from at least one action selected from the group consisting of activity, sub process and process, and wherein said action provides data which is used as a data field within said monitoring message.

18. A method as in claim 1 wherein said retrieving information from the central message repository comprises retrieving information in order to measure, monitor and track enterprise communications and processes.

19. A method as in claim 1 wherein said retrieving information from the central message repository comprises broadcasting unused pipeline capacity.

20. A method as in claim 1 wherein retrieving said information from the central message repository provides an alternative to retrieving original message data from an application that had originally generated said original message data.

21. A method as in claim 1 further comprising relieving monitoring pressure from a source application.

22. A method as in claim 1 further comprising providing a duplicate of said central message repository.

US 7,603,674 B2

11

23. A method as in claim 22 further comprising providing said duplicate to an external entity, with a communication channel established between said central message repository and said duplicate of said central message repository.

24. A method as in claim 1 further comprising providing a mirror repository of said central message repository. 5

25. A method as in claim 24 wherein said mirror repository is used by an external entity.

26. A method as in claim 25 wherein said mirror repository tracks processes, sub-processes and/or activities in whole or part. 10

27. A method as in claim 24 wherein, if more than one mirror repository is used, said repositories are combined.

28. A method as in claim 24 wherein said mirror repository is used either in addition to or instead of said central message repository. 15

29. A method as in claim 24 wherein said mirror repository or said central message repository may be used to generate messages and/or feedback to the group consisting of processes, sub-processes, activities or applications. 20

30. A method as in claim 24 wherein said mirror repository or said central message repository may be used to generate messages and/or feedback to users.

31. A method as in claim 30 wherein said messages comprise error messages. 25

32. A method as in claim 30 wherein said messages comprise event messages.

33. A method as in claim 30 wherein said messages comprise exception messages.

34. A method as in claim 30 wherein said messages comprise trigger messages. 30

35. A method as in claim 30 wherein said messages comprise threshold messages.

36. A method as in claim 30 wherein said messages comprise flagged indicators. 35

37. A method as in claim 30 wherein said messages comprise specially designated messages.

38. A method as in claim 1 wherein said retrieving information from the central message repository further comprises retrieving information from the central message repository on a secure basis. 40

39. A method as in claim 38 wherein said retrieving information from the central message repository on a secure basis further comprises a tiered secure basis, with a user obtaining retrieval rights according to the user's security classification. 45

40. A method as in claim 1 wherein said retrieving information from the central message repository further comprises permitting a user to retrieve information over a corporate extranet.

41. A method as in claim 1 further comprising providing a report. 50

42. A method as in claim 41 further comprising providing said report through an XML link to said central message repository.

43. A method as in claim 42 further comprising displaying said report. 55

44. A method as in claim 40 wherein said user comprises a customer, and said permitting a user to retrieve information over a corporate extranet further comprises permitting said customer to retrieve information concerning said customer's orders. 60

45. A method as in claim 43 wherein said display provides an option to drill down through said display for further detail.

46. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising: 65

12

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message wherein said original message data comprises status information of at least one action selected from the group consisting of activity, sub process and process; and,

distributing information from the central message repository using a real-time tool which tracks the progress of transaction records and/or processes.

47. A method as in claim 46 wherein said information is distributed using a distribution method selected from the group consisting of an intranet, an extranet, and the Internet.

48. A method as in claim 46 wherein said information is distributed to business partners.

49. A method as in claim 48 wherein said information is distributed to actual or potential business partners to check production capacity, shipping capacity, or other areas of interest.

50. A method as in claim 46 wherein said information is distributed to stock analysts to track any particular enterprise's productivity or other areas of interest. 25

51. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

providing, through a monitoring message, at least part of said original message data to a central message repository;

populating a transaction record in said central message repository with said original message data provided by said monitoring message;

reviewing data collected in said transaction record; wherein said original message data comprises status information of a process and/or sub process. 35

52. A method as in claim 51 wherein said original message data comprises at least one field of data selected from the group consisting of date data, time data, customer number data, materials data, quantity data and amount data.

53. A method as in claim 51 wherein said original message data comprises at least one field selected from the group consisting of PROCESS IDENTIFIER, SUB-PROCESS IDENTIFIER, ACTIVITY IDENTIFIER, CUSTOMER NUMBER, PART NUMBER, QUANTITY, DATE and TIME.

54. A method as in claim 51 wherein said original message data comprises at least one field selected from the group consisting of ProID, SbProID, Custno, Partno, Qty, Date and Time.

55. A method as in claim 51 further comprising providing the status of a process by providing access to said central message repository.

56. A method as in claim 51 further comprising adding, to said monitoring message, data other than said original message data.

57. A method as in claim 51 further comprising updating said transaction record.

58. A method as in claim 57 further comprising updating said transaction record by:

providing, through a second monitoring message, a second original message data to said transaction record; and,

populating said transaction record with said second original message data provided by said second monitoring message.

US 7,603,674 B2

13

59. A method as in claim 51 further comprising completing a process.

60. A method as in claim 51 further comprising completing said transaction record.

61. A method as in claim 51 further comprising aborting a process.

62. A method as in claim 61 further comprising providing, in said transaction record, an indication that the process has been aborted.

63. A central message repository created by the method of claim 51.

64. A transaction record created by the method of claim 51.

65. A method as in claim 51 wherein said process is a simulated process.

66. A method as in claim 51 wherein said sub process is a simulated sub process.

67. A method as in claim 51 wherein said original message data is simulated original message data.

68. A method as in claim 51 further comprising providing the status of a sub process by providing access to said central message repository.

69. A method as in claim 51 further comprising providing the status of an activity by providing access to said central message repository.

70. A computerized method for use in an asynchronous messaging environment, wherein said messaging environment comprises at least one original message comprised of original message data, comprising:

monitoring a sub process, which is comprised of at least a first and second activity, by generating original message data from each of said first and second activities;

transmitting said original message data from said first activity, via a first monitoring message, to a central message repository;

storing said original message data from said first activity, in a transaction record in said central message repository; transmitting said original message data from said second activity, via a second monitoring message, to said central message repository; and,

storing said original message data from said second activity, in said transaction record in said central message repository;

wherein said original message data comprises the status of said activity.

71. A method as in claim 70 further comprising determining the status of said sub process.

72. A method as in claim 70 wherein said original message data from each of said first and second activities comprises an activity specific set of data.

73. A method as in claim 70 wherein said first monitoring message further comprises altered original message data.

74. A method as in claim 70 wherein said first monitoring message further comprises data added to said original message data.

75. A method as in claim 70 further comprising reviewing said central message repository.

76. A method as in claim 75 wherein reviewing said central message repository further comprises reviewing information from the group consisting essentially of order information, customer information, process efficiency information, snapshot information, time slice information, daily information, weekly information, monthly information, trend information and performance information.

77. A method as in claim 70 further comprising distributing process progress information in real time.

78. A method as in claim 70 further comprising distributing said process progress information through broadcasting.

14

79. A method as in claim 70 further comprising distributing said process progress information through the Internet.

80. A method as in claim 70 further comprising analyzing said central message repository in order to determine a process trend.

81. A method as in claim 80 wherein said process trend is selected from the group consisting of: time between sub-processes; variances by customer; variances by order amount; bottlenecks and seasonal variations.

82. A method as in claim 81 wherein orders may be accelerated as a result of said analysis.

83. A method as in claim 70 further comprising providing a monitoring message repository.

84. A method as in claim 70 further comprising providing a report via an XML link to said central message repository.

85. A method as in claim 70 wherein said second monitoring message further comprises altered original message data.

86. A method as in claim 70 wherein said second monitoring message further comprises data added to said original message data.

87. A method as in claim 70 further comprising distributing said process progress information through Wireless Application Protocol.

88. A method as in claim 70 further comprising distributing said process progress information through an intranet.

89. A method as in claim 70 further comprising distributing said process progress information through an extranet.

90. An apparatus for use in an asynchronous messaging environment in a communications system or systems wherein said messaging environment comprises at least one original message comprised of original message data, the apparatus comprising:

means for providing, through a monitoring message, at least part of said original message data to a central message repository;

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message wherein said original message data comprises status information of at least one action selected from the group consisting of activity, sub process and process; and,

means for retrieving information from the central message repository.

91. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information about an order from the central message repository.

92. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information about a customer from the central message repository.

93. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving process efficiency information from the central message repository.

94. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving time slice information from the central message repository.

95. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information across a time span from the central message repository.

96. An apparatus as in claim 95 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

US 7,603,674 B2

15

97. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information to gauge trends from the central message repository.

98. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information to gauge performance from the central message repository.

99. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information across a time span from the central message repository to gauge trends.

100. An apparatus as in claim 99 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

101. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information across a time span from the central message repository to gauge performance.

102. An apparatus as in claim 101 wherein said time span is selected from the group consisting of at least one day, at least one week, and at least one month.

103. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information about process efficiency.

104. An apparatus as in claim 90 wherein said original message data comprises a data field.

105. An apparatus as in claim 104 wherein said data field is path specific.

106. An apparatus as in claim 90 wherein said original message data is generated from at least one action selected from the group consisting of activity, sub process and process an sub process, or process, and wherein said action provides data which is used as a data field within said monitoring message.

107. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises means for retrieving information in order to measure, monitor and/or track enterprise communications and processes.

108. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository comprises broadcasting unused pipeline capacity.

109. An apparatus as in claim 90 wherein said means for retrieving said information from the central message repository provides an alternative to means for retrieving original message data from an application that had originally generated said original message data.

110. An apparatus as in claim 90 further comprising means for relieving monitoring pressure from a source application.

111. An apparatus as in claim 90 further comprising means for providing a duplicate of said central message repository.

112. An apparatus as in claim 111 further comprising means for providing said duplicate to an external entity, with a communication channel established between said central message repository and said duplicate of said central message repository.

113. An apparatus as in claim 90 further comprising means for providing a mirror repository of said central message repository.

114. An apparatus as in claim 113 wherein said mirror repository is used by an external entity.

115. An apparatus as in claim 113 wherein said mirror repository tracks processes, sub-processes and/or activities in whole or part.

16

116. An apparatus as in claim 113 wherein, if more than one minor repository is used, said repositories are combined.

117. An apparatus as in claim 113 wherein said mirror repository is used either in addition to or instead of said central message repository.

118. An apparatus as in claim 113 wherein said mirror repository or said central message repository may be used to generate messages and/or feedback to the group consisting of processes, sub-processes, activities or applications.

119. An apparatus as in claim 113 wherein said mirror repository or said central message repository may be used to generate messages and/or feedback to users.

120. An apparatus as in claim 119 wherein said messages comprise error messages.

121. An apparatus as in claim 119 wherein said messages comprise event messages.

122. An apparatus as in claim 119 wherein said messages comprise exception messages.

123. An apparatus as in claim 119 wherein said messages comprise trigger messages.

124. An apparatus as in claim 119 wherein said messages comprise threshold messages.

125. An apparatus as in claim 119 wherein said messages comprise flagged indicators.

126. An apparatus as in claim 119 wherein said messages comprise specially designated messages.

127. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository further comprises retrieving information from the central message repository on a secure basis.

128. An apparatus as in claim 127 wherein said means for retrieving information from the central message repository on a secure basis further comprises a tiered secure basis, with a user obtaining retrieval rights according to the user's security classification.

129. An apparatus as in claim 90 wherein said means for retrieving information from the central message repository further comprises means for permitting a user to retrieve information over a corporate extranet.

130. An apparatus as in claim 90 further comprising means for providing a report.

131. An apparatus as in claim 130 further comprising means for providing said report through an XML link to said central message repository.

132. An apparatus as in claim 130 further comprising means for displaying said report.

133. An apparatus as in claim 129 wherein said user comprises a customer, and said means for permitting a user to retrieve information over a corporate extranet further comprises means for permitting said customer to retrieve information concerning said customer's orders.

134. An apparatus as in claim 132 wherein said means for displaying said report provides an option to drill down through a display generated by said means for displaying said report for further detail.

135. An apparatus for use in an asynchronous messaging environment in a communication system or systems, wherein said messaging environment comprises at least one original message comprised of original message data, the apparatus comprising:

means for providing, though a monitoring message, at least part of said original message data to a central message repository;

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message wherein said original message data comprises status information of at least

17

one action selected from the group consisting of activity, sub process and process; and,
means for distributing information from the central message repository using a real-time tool which tracks the progress of transaction records and/or processes.

136. An apparatus as in claim **135** wherein said means for distributing information comprises a means for distributing information selected from the group consisting of an intranet, an extranet, and the Internet.

137. An apparatus as in claim **136** wherein said information is distributed to business partners.

138. An apparatus as in claim **137** wherein said information is distributed to actual or potential business partners to check production capacity, shipping capacity, or other areas of interest.

139. An apparatus as in claim **136** wherein said information is distributed to stock analysts to track any particular enterprise's productivity or other areas of interest.

140. An apparatus for use in an asynchronous messaging environment in a communication system or systems, wherein said messaging environment comprises at least one original message comprised of original message data, the apparatus comprising:

means for providing, through a monitoring message, at least part of said original message data to a central message repository;

means for populating a transaction record in said central message repository with said original message data provided by said monitoring message; and,
means for updating said transaction record;

wherein said original message data comprises status information of a process and/or sub process.

141. An apparatus as in claim **140** wherein said original message data comprises at least one field of data selected from the group consisting of date data, time data, customer number data, materials data, quantity data and amount data.

142. An apparatus as in claim **140** wherein said original message data comprises at least one field selected from the group consisting of PROCESS IDENTIFIER, SUB-PROCESS IDENTIFIER, ACTIVITY IDENTIFIER, CUSTOMER NUMBER, PART NUMBER, QUANTITY, DATE and TIME.

143. An apparatus as in claim **140** wherein said original message data comprises at least one field selected from the group consisting of ProID, SbProID, Custno, Partno, Qty, Date and Time.

144. An apparatus as in claim **140** further comprising updating said transaction record by:

means for providing, through a second monitoring message, a second original message data to said transaction record; and,

means for populating said transaction record with said second original message data provided by said second monitoring message.

145. An apparatus as in claim **140** further comprising completing a process.

146. An apparatus as in claim **140** further comprising completing said transaction record.

147. An apparatus as in claim **140** further comprising aborting a process.

148. An apparatus as in claim **140** further comprising providing, in said transaction record, an indication that the record has been abandoned.

149. A central message repository created by the method of claim **140**.

150. A transaction record created by the method of claim **140**.

18

151. An apparatus as in claim **140** wherein said process is a simulated process.

152. An apparatus as in claim **140** wherein said sub process is a simulated sub process.

153. An apparatus as in claim **140** wherein said original message data is simulated original message data.

154. An apparatus for use in an asynchronous messaging environment in a communication system or systems, wherein said messaging environment comprises at least one original message comprised of original message data, the apparatus comprising:

means for monitoring a sub process, which is comprised of at least a first and second activity, by generating original message data from each of said first and second activities;

means for transmitting said original message data from said first activity, via a first monitoring message, to a central message repository;

means for storing said original message data from said first activity, in a transaction record in said central message repository;

means for transmitting said original message data from said second activity, via a second monitoring message, to said central message repository; and,

means for storing said original message data from said second activity, in said transaction record in said central message repository;

wherein said original message data comprises the status of said activity.

155. An apparatus as in claim **154** further comprising determining the status of said sub process.

156. An apparatus as in claim **154** wherein said original message data from each of said first and second activities comprises an activity specific set of data.

157. An apparatus as in claim **155** wherein said first monitoring message further comprises altered original message data.

158. An apparatus as in claim **155** wherein said first monitoring message further comprises data added to said original message data.

159. An apparatus as in claim **155** further comprising means for reviewing said central message repository.

160. An apparatus as in claim **159** wherein reviewing said central message repository further comprises reviewing information from the group consisting essentially of order information, customer information, process efficiency information, snapshot information, time slice information, daily information, weekly information, monthly information, trend information and performance information.

161. An apparatus as in claim **155** further comprising distributing process progress information in real time.

162. An apparatus as in claim **161** further comprising distributing said process progress information through broadcasting.

163. An apparatus as in claim **161** further comprising distributing said process progress information through the Internet.

164. An apparatus as in claim **155** further comprising analyzing said central message repository in order to determine a process trend.

165. An apparatus as in claim **154** wherein said process trend is selected from the group consisting of: time between sub-processes, variances by customer, variances by order amount, bottlenecks and seasonal variations.

166. An apparatus as in claim **165** wherein orders may be accelerated as a result of said analysis.

US 7,603,674 B2

19

167. An apparatus as in claim 155 further comprising providing a monitoring message repository.

168. An apparatus as in claim 155 further comprising providing a report via an XML link to said central message repository.

169. An apparatus as in claim 155 wherein said second monitoring message further comprises altered original message data.

170. An apparatus as in claim 155 wherein said second monitoring message further comprises data added to said original message data.

20

171. An apparatus as in claim 155 further comprising distributing said process progress information through Wireless Application Protocol.

172. An apparatus as in claim 155 further comprising distributing said process progress information through an intranet.

173. An apparatus as in claim 155 further comprising distributing said process progress information through an extranet.

(57) **ABSTRACT**

The present invention comprises apparatus and systems for measuring, monitoring, tracking and simulating enterprise communications and processes. A central message repository or database is constructed, comprised of monitoring messages sent from process messaging systems. The database may then be accessed or queried as desired. A simulation tool assists in reviewing present and proposed processes and sub-processes before modifying existent systems or creating new systems.
